

Development of a Mental Health Progress Tracker

Objective:

Create a simple web application using React for the frontend and Node.js for the backend, which allows patients to log their daily mental health statuses and view trends over time. The application should be secure and user-friendly, covering sensitivity to the needs of mental health patients.

Requirements:

Frontend (React)

- **User Authentication:** Implement login with Google for authentication.
- **Daily Log Form:** Create a form where users can submit their daily mental health status. The form accepts the following on each day:
 - **Mood Ratings:** Self-reported mood on a scale, typically from very sad to very happy.
 - **Anxiety Levels:** Self-assessed anxiety levels.
 - **Sleep Patterns:** Hours of sleep, quality of sleep, and any disturbances.
 - **Physical Activity:** Type and duration of physical activity.
 - **Social Interactions:** Frequency of social engagements.
 - **Stress Levels:** Self-reported stress levels.
 - **Symptoms of Depression or Anxiety:** Presence and severity of specific symptoms.
- **Data Visualization:** Display a graph or chart summarizing the user's weekly/monthly trends for any three parameters.
- **Implement WebSocket or similar technology** to update the data visualization in real-time as new entries are added.
- **Interactive UI/UX Design:** Enhance the frontend with interactive elements like modals, tooltips, and transitions to guide the user through the daily log process.

Requirements:

Backend (Node.js)

- **API Endpoints:**
 - User authentication endpoints.

- POST /log: Endpoint to submit daily logs.
- GET /logs: Retrieve logs for visualization.
- **Database Integration:** Use a simple database (like SQLite) to store user credentials and daily logs.

Submission Guidelines:

Submit the project as a repository link on GitHub or a similar platform.
